# CMPUT 329 - Computer Organization and Architecture II Midterm Exam - Fall 2001 

Prof. José Nelson Amaral<br>Computing Science Department<br>University of Alberta

Name:

## CMPUT 329 Honor Code

By turning in the exam solution for grading, I certify that I have worked all the solutions on my own, that I have not copied or transcribed solutions from a classmate, someone outside the class, or from any other source. I also certify that I have not facilitated or allowed any of my classmates to copy my own solutions. I am aware that the violation of this honor code constitutes a breach of the trust granted me by the teaching staff, compromises my reputation, and subjects me to the penalties prescribed in Section 26.1 of the University of Alberta 2001/2002 Calendar.

Edmonton, October 22, 2001.

Figure 1: A combinatorial circuit for analysis

## Question 1 (20 points):

For the circuit presented in Figure 1 you are asked to:
a. (5 points) Write the logic expression for the output $F$ in terms of the inputs $W, X, Y$, and $Z$. Your expression for $F$ should reflect the structure of the circuit, do not simplify.
b. (5 points) What is the cost of implementing this circuit?
c. (5 points) Now simplify $F$ algebraically, indicating all the intermediary steps of your simplification, to generate a (at most) 2-level NAND-NAND expression.
d. (5 points) What is the cost of implementing the circuit after your algebraic simplification (assume that the complement of the input signals are not available, but the cost of each NAND is equal the number of inputs in the NAND gate)?

Figure 2: Karnaugh Map for $F(V, W, X, Y, Z)$ A combinatorial circuit for analysis

## Question 2 (20 points):

During your first week working at ACME Electronic Solutions you are told that their PLA down-loader is not working. They need you to implement some small circuits that were originally designed using VHDL. Because PLAs are not available, you have to use discrete LSI logic gates to meet the deadline for testing an important product. One of the functions that you have to implement is the glue logic function $F$ that was specified by the VHDL code below. Remember that in the std_logic type defined in the IEEE.std_logic_1164, '-' is the symbol used for don't care. In the Karnaugh Map of Figure 1(b):

```
entity gluefunc is
    port (V, W, X, Y, Z: in STD_LOGIC;
        F: out STD_LOGIC);
end gluefunc
architecture gluefunc_arc of gluefunc is
begin
    F <= '1' when (V='O' and W='O' and X='O') else
            '1' when ( }V='0' and X='O' and Y='O') els
            '1' when ( }V='1' and W='1' and Y='0' and Z='0') els
            '1' when (V='1' and W='0' and X='0' and Y='1') else
            '_' (when X='1' and Y='1')
            else '0';
end gluefunc_arc
```

a. (10 points) Fill the Karnaugh Map of Figure 2 using the values specified for the function $F(V, W, X, Y, Z)$ in the VHDL code.
b. (5 points) What is the cost of a minimal sum-of-products implementation of this function (assume that both the input signals and their complements are already available)?
c. (5 points) What is the cost of the implementation if you have to ensure that there is no static-1 hazard(assume that both the input signals and their complements are already available)?

Figure 3: (a) A multiplex that implements a combinatorial function; (b) Karnaugh Map

## Question 3 (20 points):

The $74 \times 151$ shown in Figure 3(a) is an 8 -to-1 multiplex that is being used to implement a combinatorial function $F(A, B, C, D)$.
a. (10 points) Fill the Karnaugh map of Figure 3(b) with the logic function $F(A, B, C, D)$ that is realized by the circuit of Figure 3(a).
b. (10 points) Using only XOR gates, draw a minimized logic diagram that implements the same function.
(a)

(b)

| $S$ | $R$ | $C$ | $Q$ | $Q N$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | last Q | last QN |
| 0 | 1 | 1 | 0 | 1 |
| 1 | 0 | 1 | 1 | 0 |
| 1 | 1 | 1 | 1 | 1 |
| x | x | 0 | last Q | last QN |

(c)

Figure 4: S-R latch with enable input; (a) circuit using NAND gates, (b) function table; (c) logic symbol

## Question 4 (20 points):

Figure 4 shows the circuit for an S-R latch with $C$ enable input.
a. (10 points) Draw, in the figure, the changes that you need to do to this circuit in order to obtain a D latch with a $C$ enable input.
b. (10 points) In the space below, draw the function table for the D latch that you created with your circuit modifications in the picture.

Figure 5: Combinatorial Circuit for Time Analysis

## Question 5 (20 points):

For the combinatorial circuit of Figure 5, assume that all circuits are 74LS, and use the delays for the 2 level version of the 74LS86. Using the Tables of Figures 6 and 7, and :
a. (10 points) Determine the maximum propagation delay from a transition on the MIN/MAX input to a change in the $Z$ output.
b. (10 points) Determine the maximum propagation delay from a transition on the $X$ input to a change in the $Z$ output.
