

# Structural Programming and Data Structures

Winter 2000

## CMPUT 102: Tracing Programs

Dr. Osmar R. Zaïane

University of Alberta

## Course Content

- Introduction
- Objects
- Methods
- **Tracing Programs**
- Object State
- Sharing resources
- Selection
- Repetition
- Vectors
- Testing/Debugging
- Arrays
- Searching
- Files I/O
- Sorting
- Inheritance
- Recursion

## Objectives of Lecture 11

### Tracing Programs and the Debugger

- Learn how to trace the execution of a Java program.
- Understand what is happening during the execution of a program.
- Use program tracing:
  - to find errors in programs;
  - to understand what a program is supposed to do.
- Introduce the debugging facilities.

## Outline of Lecture 11

- Example of a new program
- Notation for hand tracing
- Hand tracing Adventure
- The Code Warrior Debugger
- Tracing the example program again

```
public class Tunes {  
    /*  
     * Creates a collection of CDs. Adds CDs to the collection  
     * and displays a summary of the collection value.  
     */  
  
    public static void main(String args[]) {  
        /* Program statements go here */  
  
        CD_Collection music;  
  
        music = new CD_Collection(5, 50.00f);  
  
        music.addCDs(1, 10.99f);  
        music.addCDs(3, 20.99f);  
        music.displayCDs();  
  
    }  
}  
  
class CD_Collection {  
    /* Monitors the value of a collection of musical CDs. */  
  
    /* Private instance variables */  
  
    private int numCDs;  
    private float valueCDs;  
  
    public CD_Collection (int initialNum, float initialVal) {  
        /*  
         * Initializes the collection with the given number of CDs  
         * and the given value of the CD collection.  
         */  
  
        this.numCDs = initialNum;  
        this.valueCDs = initialVal;  
    }  
}
```

```

public void add_CDs(int number, float value) {
    /*
     * Adds CDs to the collection and adjusts the total value.
     */
    this.numCDs = this.numCDs + number;
    this.valueCDs = this.valueCDs + value;
}

public void displayCDs() {
    /*
     * Displays the number of CDs in the collection and the total
     * value of the collection.
     */
    System.out.println("=====");
    System.out.print("Total Number of CDs: ");
    System.out.print(this.numCDs);
    System.out.print("Total Value of Collection: ");
    System.out.print("Average cost per CD: $");
    System.out.print(this.averageCost);
    System.out.println("=====");
}

private float averageCost() {
    /*
     * Determines the average cost of a CD in the collection.
     */
    float average;

    average = this.valueCDs / this.numCDs;

    return average;
}

```

# Outline of Lecture 11

- Example of a new program
  - Notation for hand tracing
  - Hand tracing Adventure
  - The Code Warrior Debugger
  - Tracing the example program again

# Tracing

- Tracing is a technique that follows the execution of program in detail.
  - Tracing can be used to understand how a Java program works.
  - Tracing can also be used to find semantic errors in a program.
  - A program can be hand traced by drawing diagrams.
  - A program can also be traced using a tool called a debugger.

© Dr. Osmar R. Zaïane, 2000

Structural Programming and Data Structures

# Notation for Hand Tracing

- Every method is represented by a rectangle.
  - Every object is represented by an oval labeled by its class or its contents.
  - Every reference is represented by a rectangle in the method that declares it.
  - However, you can ignore public imported variables.
  - Every reference has an arc connecting it to the object that it references.

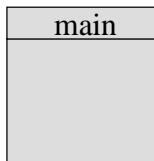

# Outline of Lecture 11

- Example of a new program
- Notation for hand tracing
- Hand tracing Adventure
- The Code Warrior Debugger
- Tracing the example program again

## Adventure Trace - call main

- Since this is an application, the interpreter invokes the static method called *main*.
- Since *main* is static, there is no *- this*.

## Adventure Trace - main

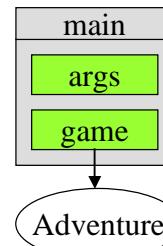

- The parameter *args* is a reference
- The variable *game* is a reference

```
public static void main(String args[]) {  
    Adventure game; ←|||  
  
    game = new Adventure();  
    game.play();  
}
```

## Adventure Trace - main - game

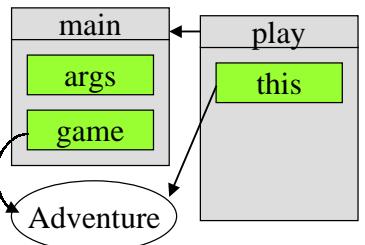

- When the new *Adventure* object is created we draw it and when the *game* reference is bound to the new object we connect it.

```
public static void main(String args[]) {  
    Adventure game;  
  
    game = new Adventure(); ←|||  
    game.play();  
}
```

## Adventure Trace - call play

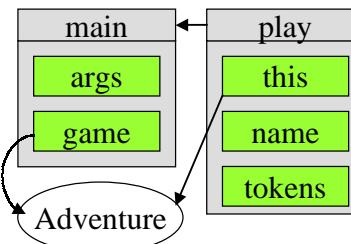

- When the play() message is sent to the *game* object, we draw a rectangle for the play() method that contains the reference *this*, connect the methods and bind the *this* reference to the receiver object.

```
public static void main ...  
    Adventure game;  
  
    game = new Adventure();  
    game.play();
```

## Adventure Trace - play

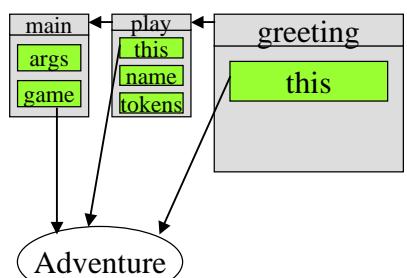

- There are no method parameters, there are two variables, *name* and *tokens*.

```
private void play() {  
    String name;  
    Integer tokens;  
    name = this.greeting();  
    tokens = this.enterRoom(name);  
    this.farewell(name, tokens);  
}
```

## Adventure Trace - call greeting

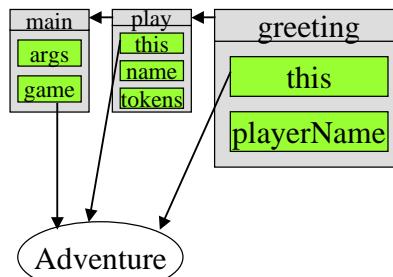

- When greeting() is sent to the *this* object, we draw a greeting() method with a new *this* reference, connect the methods and bind the new *this* to the receiver object.

```
private void play() {  
    String name;  
    Integer tokens;  
  
    name = this.greeting();  
    tokens = this.enterRoom(name);  
    this.farewell(name, tokens);  
}
```

## Adventure Trace - greeting

- There are no method parameters, there is one variable, *playerName*.

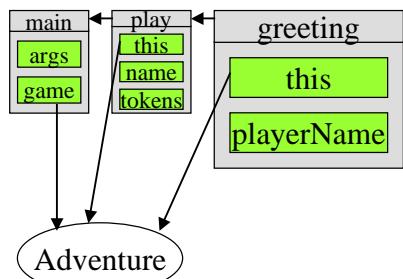

```
private String greeting() {  
    String playerName;  
  
    System.out.println("Wel ...");  
    System.out.print("The date is ");  
    System.out.print(new Date());  
    System.out.println();  
    ...  
}
```

## Adventure Trace - greeting output

- Output some information.

Welcome to the Arithmetic ...  
The date is Tue February 1 ...  
...

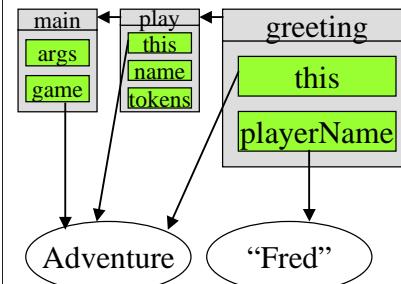

What is your name?

```
private String greeting() {  
    String playerName;  
  
    System.out.println("Wel ...");  
    System.out.print("The date is ");  
    System.out.print(new Date());  
    System.out.println();  
    ...  
    System.out.print("What is ...");  
    ...  
}
```

## Adventure Trace - greeting input

- Send `readString()` to the keyboard, get back a `String` object that represents what the user typed and bind `playerName` to it.

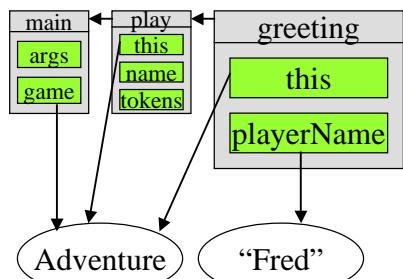

```
private String greeting() {  
    String playerName;  
    ...  
    System.out.print("What is ...");  
    playerName =  
        Keyboard.in.readString();  
    ...  
}
```

Welcome to the Arithmetic ...  
The date is Tue February 1 ...  
...  
What is your name?Fred

## Adventure Trace - greeting pause

- Output some more information and ask the keyboard to pause.
- Wait until the user presses the ENTER key.

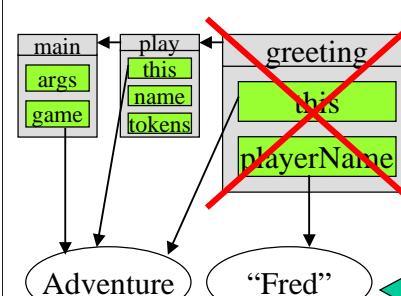

```
private String greeting() {  
    String playerName;  
    ...  
    System.out.println("... air!");  
    Keyboard.in.pause();  
    return playerName;  
}
```

... mathematical magic in the air!  
Press the ENTER key to continue ...

## Adventure Trace - greeting return

- Return the object bound to the variable `playerName` as the result of the message and discard the method.

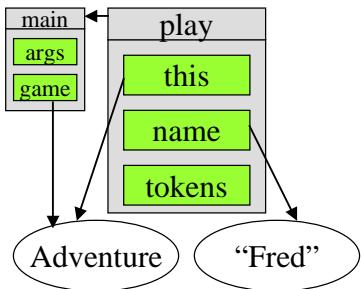

```
private String greeting() {  
    String playerName;  
    ...  
    System.out.println("... air!");  
    Keyboard.in.pause();  
    return playerName;  
}
```

return this object

## Adventure Trace - play name

- Bind the variable *name* to the object that was returned from the greeting() message.

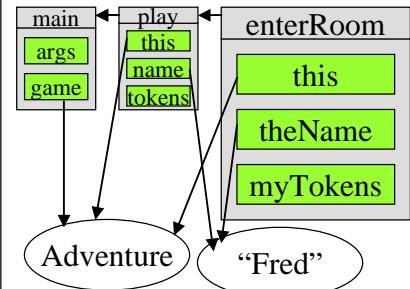

```
private void play() {
    String name;
    Integer tokens;

    name = this.greeting();
    tokens = this.enterRoom(name);
    this.farewell(name, tokens);
}
```

## Adventure Trace - enterRoom

- There is a method parameter called *theName* that is bound to the argument object and a variable, *myTokens*.

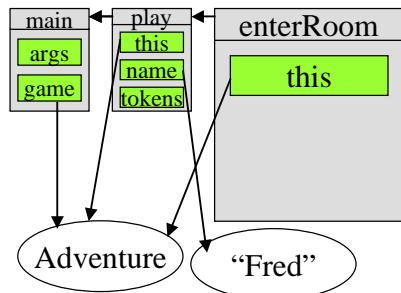

```
private Integer enterRoom(
    String theName){
    Integer myTokens;

    System.out.print("How many... ");
    System.out.print(theName);
    System.out.print("?");
    myTokens =
        Keyboard.in.readInteger();
    return myTokens;
}
```

## Adventure Trace - call enterRoom

- When `enterRoom()` is sent to *this*, we draw an `enterRoom()` method with a new *this* reference, connect the methods and bind the new *this* to the receiver object.

```
private void play() {
    String name;
    Integer tokens;

    name = this.greeting();
    tokens = this.enterRoom(name);
    this.farewell(name, tokens);
}
```

## Adventure Trace - enterRoom input

- Output some information, input an Integer from the keyboard and bind *myTokens* to it.

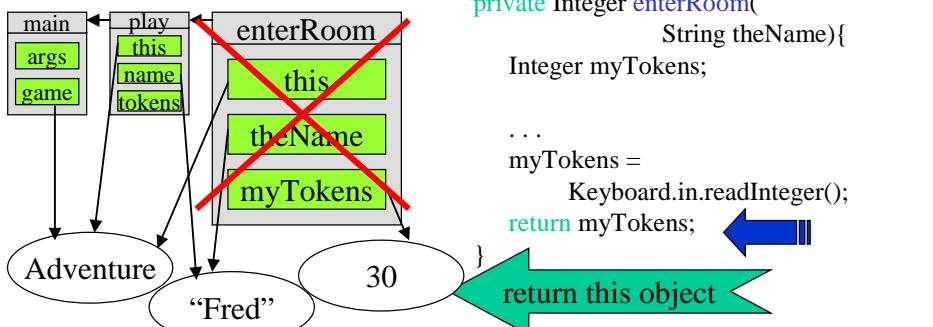

```
private Integer enterRoom(
    String theName){
    Integer myTokens;

    System.out.print("How many... ");
    System.out.print(theName);
    System.out.print("?");
    myTokens =
        Keyboard.in.readInteger();
    return myTokens;
}
```

## Adventure Trace - enterRoom return

- Return the object bound to the variable *myTokens* as the result of the message and discard the method.

Structural Programming and Data Structures

University of Alberta 25

## Adventure Trace - call farewell

- When *farewell()* is sent to *this*, we draw a *farewell()* method with a new *this* reference, connect the methods and bind the new *this* to the receiver object.

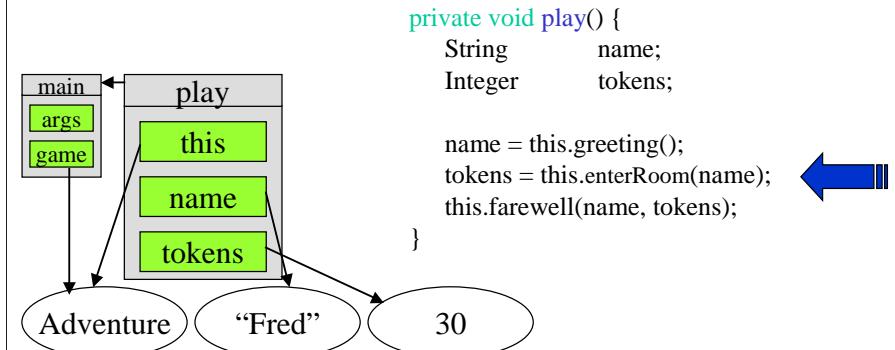

© Dr. Osmar R. Zaiane, 2000

Structural Programming and Data Structures

University of Alberta 27

## Adventure Trace - play tokens

- Bind the variable *tokens* to the object that was returned from the *enterRoom()* message.

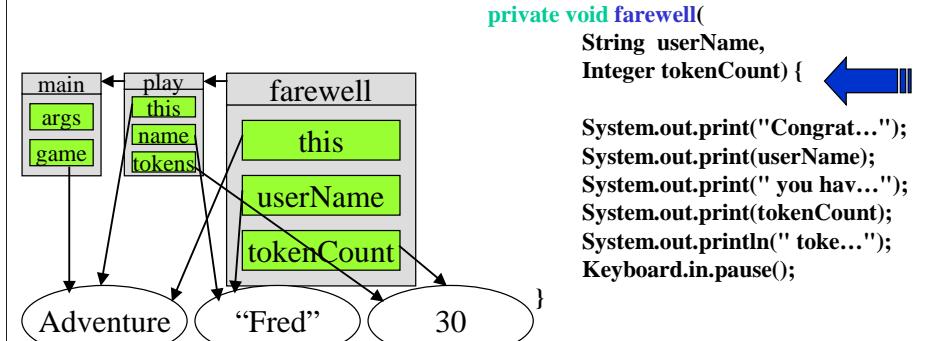

© Dr. Osmar R. Zaiane, 2000

Structural Programming and Data Structures

University of Alberta 26

## Adventure Trace - farewell

- There are method parameters called *userName* and *tokenCount* that are bound to the argument objects and no variables.

© Dr. Osmar R. Zaiane, 2000

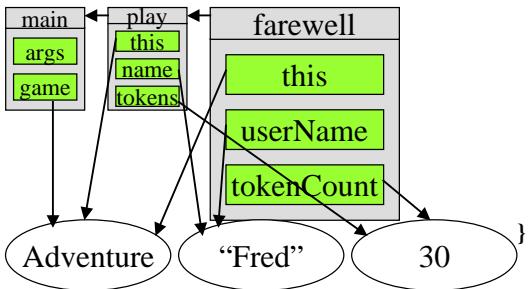

Structural Programming and Data Structures

University of Alberta 28

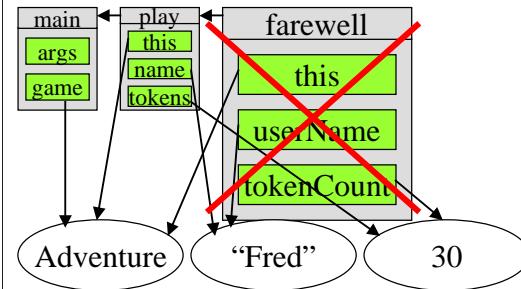

## Adventure Trace - farewell output

- Output some information and ask the keyboard to pause.
- Wait until the user presses the ENTER key.

```
private void farewell(  
    String userName,  
    Integer tokenCount) {  
  
    System.out.print("Congrat... ");  
    System.out.print(userName);  
    System.out.print(" you hav...");  
    System.out.print(tokenCount);  
    System.out.println(" toke...");  
    Keyboard.in.pause();  
}
```

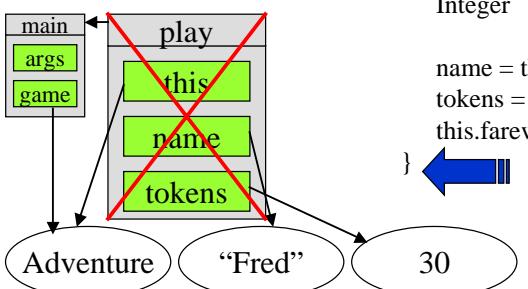

```
private void farewell(  
    String userName,  
    Integer tokenCount) {  
  
    System.out.print("Congrat... ");  
    System.out.print(userName);  
    System.out.print(" you hav...");  
    System.out.print(tokenCount);  
    System.out.println(" toke...");  
    Keyboard.in.pause();  
}
```

## Adventure Trace - play return

- This method does not return a result so just discard the method.

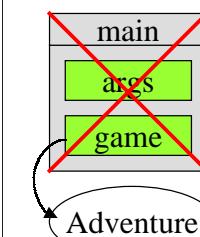

```
private void play() {  
    String name;  
    Integer tokens;  
  
    name = this.greeting();  
    tokens = this.enterRoom(name);  
    this.farewell(name, tokens);  
}
```

## Adventure Trace - main return

- The static `main` method does not return a result so just discard the method.
- The program is now done.

```
public static void main ...  
    Adventure game;  
  
    game = new Adventure();  
    game.play();  
}
```

## Demonstration Debugger

- Trace Adventure Version 2 in CodeWarrior using the debugger.
- A demo of the debugger will be given in the lab.
- The Debugger will allow you to execute your Java program statement by statement, and visualize your objects and variables during runtime.

```
public class Tunes {  
    /*  
     * Creates a collection of CDs. Adds CDs to the collection  
     * and displays a summary of the collection value.  
     */  
  
    public static void main(String args[]) {  
        /* Program statements go here */  
  
        CD_Collection music;  
  
        music = new CD_Collection(5, 50.00f);  
  
        music.addCD(1, 10.99f);  
        music.addCD(3, 20.99f);  
        music.displayCDs();  
    }  
}
```

```
class CD_Collection {  
    /* Monitors the value of a collection of musical CDs. */  
  
    /* Private instance variables */  
  
    private int numCDs;  
    private float valueCDs;  
}
```

```
public CD_Collection (int initialNum, float initialVal) {  
    /*  
     * Initializes the collection with the given number of CDs  
     * and the given value of the CD collection.  
     */  
  
    this.numCDs = initialNum;  
    this.valueCDs = initialVal;  
}
```

```
